# HALDIMAND COUNTY 

## DESIGN CRITERIA

## SECTION K

## WASTEWATER COLLECTION SYSTEM

K 1.00 GENERAL

All sanitary sewer and appurtenances are to be designed and constructed in accordance with current Ministry of the Environment and Climate Change (MOECC) Guidelines for the Design of Sewage Works and Ontario Provincial Standards Drawings and Specifications.

Design computations for sanitary sewer systems must be completed on a standard calculation sheet in the format recommended by MOECC guidelines (attached at the end of this section).

Sanitary sewers are not permitted to accept foundation or weeping tile, sump pumps or roof drainage.

All sewers shall be designed for an embankment condition.
In cases of new subdivisions, the consulting Engineer is required to establish the geodetic invert elevations and ties of all sanitary sewer connections at street line and to make this information available on the as-built plans to Haldimand County.

## K 2.00 DESIGN FLOW

K 2.01 AVERAGE DRY WEATHER FLOW

| Type of Development | Equivalent Population <br> Density <br> (persons/hectare) | Unit Sewage Flow |  |
| :--- | :--- | :--- | :--- |
|  |  |  |  |
| Residential | 55 | 0.410 | $4.7 \times 10^{-6}$ |
| Single Family | 100 | 0.275 | $3.2 \times 10^{-6}$ |
| Semi-detached, duplex <br> \& 4-plex | 0.275 | $3.2 \times 10^{-6}$ |  |
| Townhouse, maisonette, 6 <br> story apartment or less | 135 | 0.275 | $3.2 \times 10^{-6}$ |
| Apartments (over 6 stories <br> high) | 285 |  |  |

| Industrial / Commercial / Institutional (ICI) |  |  |  |  |  |  |  |
| :--- | :--- | :--- | :--- | :---: | :---: | :---: | :---: |
| Schools <br> a) Boarding schools <br> b)Day schools with <br> cafeterias <br> C) <br> Day schools without <br> cafeterias | 0.3 | $3.5 \times 10^{-6}$ |  |  |  |  |  |
|  |  |  |  |  |  | 0.08 | $0.9 \times 10^{-6}$ |
| Light Commercial Areas | 90 | 0.06 | $0.7 \times 10^{-6}$ |  |  |  |  |
| Community Services | 40 | 40.5 | $4.688 \times 10^{-4}$ |  |  |  |  |
| Light Industrial Areas | 125 | 18.0 | $2.083 \times 10^{-4}$ |  |  |  |  |
| Hospitals | 4 persons/bed | $1.8 \mathrm{~m}^{3} / \mathrm{day} / \mathrm{bed}$ | $2.080 \times 10^{-5}$ <br> $\mathrm{~m}^{3} / \mathrm{s} / \mathrm{bed}$ |  |  |  |  |

These population densities are guidelines only. Individual studies shall be made for special commercial establishments, major commercial areas and special industrial and major industrial areas.

For recommended maximum dwelling unit densities see K 11.0 (b). The design of sanitary sewers should be based on the ultimate sewage flows.

## K 2.02 <br> PEAK SANITARY FLOW FACTOR

The peak sanitary flow will be derived by applying the ratio established by the Harmon formula to the average sanitary flow for residential and community services area as follows: Refer to peaking factor table at the end of this section.

$$
M=1+\frac{14}{4+P^{0.5}}
$$

$$
2 \leq M \leq 5
$$

Where $\quad M=$ ratio of peak flow to average flow

$$
P=\text { the tributary population in thousands }
$$

For commercial and industrial land uses, the peaking factor will be determined from a modified Harmon formula as follows:

$$
M e=0.8\left(1+\frac{14}{4+P e^{0.5}}\right)
$$

Where $\quad M e=$ ratio of peak flow to average flow
$P e=$ equivalent tributary population in thousands
When tributary area consists of combined residential, industrial and commercial land uses, the peaking factor shall be calculated using the modified Harmon formula where $K a v$ shall be determined as follows:

$$
M a v=\operatorname{Kav}\left(1+\frac{14}{4+(P+P e)^{0.5}}\right)
$$

$$
\text { Where } \quad \begin{aligned}
K a v & =A R+0.8(A L+A C) \\
A R & =\text { residential area } \\
A L & =\text { industrial area } \\
A C & =\text { commercial area }
\end{aligned}
$$

## K 2.03 INFILTRATION ALLOWANCE

Except under unusual circumstances, infiltration allowance shall be determined at $2.3 \times 10^{-4} \mathrm{~m}^{3} / \mathrm{s} / \mathrm{ha}\left(19.872 \mathrm{~m}^{3} /\right.$ day $/ \mathrm{ha}$ ) for all land use types.

## K 2.04 DESIGN FLOW

Design Flow = Av. Dry Weather Flow $\mathbf{x}$ Av. Peak Sanitary Flow Factor $\boldsymbol{+}$ Infiltration Allowance.

K 3.00 PIPE SIZE
To determine the pipe size and its capacity, Manning's Formula shall be used. Manning's Formula is expressed as:

$$
Q=1 / n \times R^{2 / 3} \times S^{1 / 2} \times A
$$

```
Where \(\quad Q=\) design flow \(\left(\mathrm{m}^{3} / \mathrm{sec}\right)\)
    \(\mathrm{n}=\) Manning Roughness coefficient factor (dimensionless)
    \(\mathrm{R}=\) hydraulic radius ( m )
    \(S\) = slope ( \(\mathrm{m} / \mathrm{m}\) )
    \(A=\) section area of flow \(\left(\mathrm{m}^{2}\right)\)
```

For all smooth walled pipe, the coefficient of roughness shall be 0.013.

For Residential Areas, minimum diameter shall be 200 mm . The minimum grade on a 200 mm sanitary sewer is $0.40 \%$ if minimum 13 units are connected. Where there are only a few dwelling units connected to the upper section of a 200 mm sanitary sewer, the minimum grades shall be adjusted as follows:

| 1 to 5 units | $0.65 \%$ |
| :--- | :--- |
| 6 to 8 units | $0.55 \%$ |
| 9 to 12 units | $0.45 \%$ |

If the minimum flowing full velocity cannot be achieved on the uppermost run of sewer in a system using a 200 mm pipe, then 150 mm pipe at a minimum slope of $1 \%$ may be permitted.

For Commercial and Industrial Areas, minimum diameter shall be 300 mm at minimum grade of $0.25 \%$.

## K 4.00 FLOW VELOCITIES

The flow velocity may be determined from standard tables at the back of this section, or by $V=Q / A$

Where $\quad Q=$ design flow $\left(\mathrm{m}^{3} / \mathrm{sec}\right)$
$A=$ cross-sectional area of flow $\left(m^{2}\right)$
The maximum velocity shall not be greater than $3 \mathrm{~m} / \mathrm{sec}$ with the pipe flowing full and the minimum velocity shall not be less than $0.60 \mathrm{~m} / \mathrm{sec}$. The actual velocity for a 200 mm pipe (or greater) shall not be less than $0.5 \mathrm{~m} / \mathrm{s}$.

## K 5.00 SEWER PIPE

K 5.01 MATERIALS
Sanitary sewers shall be constructed of rigid or flexible pipe meeting OPSS and AWWA standards. The type and classification of all sanitary sewer pipe and the sewer bedding type shall be clearly indicated on all profile drawings for each sewer length.

## K 5.02 PIPE BEDDING

The class of pipe and the type of bedding shall be selected to suit loading and proposed construction conditions. All pipes are to be designed assuming an embankment condition. Details of the types of bedding are to be as illustrated in the Ontario Provincial Standard Drawings. In general, Granular A compacted to $95 \%$ Proctor Density to

Springline with a minimum 300 mm sand cover above the crown shall be used for sewers in new developments.

K 6.00 PIPE DEPTH
The top of the sewer pipe shall be a minimum of 2.75 m below the centerline of the road.

## K 7.00 PIPE LOCATION

The sewer line shall be located in accordance with typical road section drawing (attached at the end of Section G). All trenches crossing the travelled portion of the roadway shall be backfilled as according to Section G - Roadways; Subsection G10.04.

K 8.00 TYPE OF PIPE AND JOINT ACCEPTABLE FOR SANITARY SEWER MAINS
K 8.01 CONCRETE PIPE
For Residential and Commercial areas, concrete pipe may be used for pipe sizes greater than or equal to 300 mm diameter.

All concrete pipe and fittings shall conform in all respects to the requirements of the current standards of the American Society of Testing and Materials (ASTM) as follows:
a) Class 2 and Class 3 Non-Reinforced Concrete Pipe, CSA A257.1.
b) Reinforced Concrete Pipe, Classes 50-D to 140-D inclusive, CSA A257.2.

Gaskets for concrete pipe shall meet the requirements of current ASTM Designation C443.

Maximum allowable Joint Deflection is $66 \%$ of manufacturer's recommendations.

## K 8.02 POLYVINYL CHLORIDE (P.V.C.) PIPE

P.V.C. pipe may be used, provided the requirements of OPSS, CSA and A.S.T.M. designation D-3034-77 are met for sizes up to and including 375 mm diameter and A.S.T.M. designation $\mathrm{F}-679$ for sizes 450 mm to 675 mm diameter.

For residential areas, P.V.C. pipe from 200 mm to 675 mm diameter may be used.

For commercial and industrial areas, P.V.C. pipe from 300 mm to 675 mm
diameter may be used.
All joints using flexible Electrometric seals shall conform to current requirements of A.S.T.M. designation D-3212.

Maximum allowable Joint Deflection is $66 \%$ of manufacturer's recommendations.

K $9.00 \quad$ CURVED SEWERS
Generally, curved sanitary sewers should be avoided. In case where suitability and efficiency of design suggest doing so, County will determine approval condition on a site-specific basis.

K 9.01 REINFORCED CONCRETE PIPE
Radius pipe (also referred to as beveled or mitered pipe) may be used for short radius bends. The pipe shall meet the requirements of CSA 257.2 or A.S.T.M C-76 for reinforced concrete radius pipe for sizes 525 mm - 3050mm diameter.

NOTE: for flat curves (long radius), straight pipe with joint deflections is permissible. Maximum joint deflection shall be 13mm to conform to CSA 257.3 or A.S.T.M C-443.

K 9.02 P.V.C. PIPE
The allowable minimum curve radius recommended by the manufacturer shall not be exceeded. Deflection in the joint is not allowed.

Saddle type connections are not permitted. Tee connections are permitted, but the designer must take into consideration the tangent lengths of the tee connections when calculating the minimum achievable radius.

K 10.00 MANHOLE TYPES
Manholes may be constructed of pre-cast or poured concrete. O.P.S.D. details shall be used for manhole design where applicable. Although these Standard Drawings provide details for manholes up to certain maximum depths and sizes, the consulting Engineer shall analyse, individually, each application of the standards relative to soil conditions, loading and other pertinent factors to determine structural suitability. In all cases where the Standard Drawings are not applicable, the manholes shall be individually designed and detailed. Working drawings must be provided for poured-in-place structures.

A reference shall be made on all profile drawings to the type and size of all manholes. In the case of the standard $1,200 \mathrm{~mm}$ pre-cast manhole, the size of the manhole may be omitted and reference need only be made to the standard O.P.S.D. number and complementing component numbers (OPSD 701.030, $701.031 \& 701.032$ ).

The corresponding O.P.S.D. reference number(s) can be included on the drawings for pre-cast manholes that are greater in diameter than the standard $1,200 \mathrm{~mm}$.

Pre-cast manholes shall conform to A.S.T.M. Specification C-478M latest revision.

## K 10.01 MANHOLE DESIGN

(a) All manhole chamber openings shall be located on the side of the manhole parallel to the flow for straight run manholes, or on the upstream side of the manhole at all junctions.
(b) The direction of flow through any manhole shall not be permitted at acute interior angles.
(c) Safety gratings are required at the mid-point depth of manhole, when the depth is between 5.0 and 10.0 m . Additional safety grates are required at third-point depths, when the manhole is equal to or greater than 10.0 m to 15.0 m deep. All in-coming pipes are to be below safety gratings, where possible.
(d) The obvert of the inlet pipe(s) shall not be lower than the obvert of the outlet pipe.

The minimum drop across manholes shall be as follows:

## Change of Direction

0 degree to 15 degrees 15
16 degree to 45 degrees
46 degrees to 90 degrees

30
Minimum Drop (mm)

60
(e) Where the difference in elevation between the obvert of the inlet and outlet pipes exceeds 0.6 m , a drop structure shall be placed on the inlet pipe, with the invert of the drop pipe located at the spring line of the outlet pipe. Design shall be in conformity with OPSD's.
(f) All sewer manholes shall be benched to the obvert of the outlet pipe on a vertical projection from the spring line of the sewer.
(g) The minimum width of benching in all manholes shall be 230 mm .
(h) Manholes in boulevards shall be located, wherever possible, a minimum of 1.5 m from the face of curb or other utilities or street furniture.

The maximum spacing between manholes shall be as follows:

## Pipe Size

$200-300 \mathrm{~mm}$
375 mm to 750 mm
825 mm to 1200 mm
1200 mm and over

## Maximum Manhole Spacing

95 metres
100 metres
125 metres
150 metres
(i) Manholes are required at all mainline pipe junctions, and at any changes in grade or alignment.

## K 10.02 GRADES FOR MANHOLE FRAME AND COVERS

All manholes located within the travelled portion of roadway shall have the rim elevation set flush with the surface of the base course asphalt. The adjustment of the frame and cover shall be completed in accordance with the details provided in the Ontario Provincial Standard Drawings.
After final application of surface asphalt the manhole frame and grates shall be adjusted to surface elevation through a poured in place concrete ring. The concrete ring shall be constructed through coring through the full depth of the asphalt. The frame and grate shall be set to match the elevation and cross fall of the final asphalt grade. A sonotube form shall be installed as to match the manhole chimney opening. The concrete shall be placed neat to the edge of the asphalt core and shall be trowelled as to match the existing lines and grade of the asphalt surface. The surface of the concrete shall receive a brushed finish.

Alternatively a Mueller model "the Adjustable" or equivalent manhole frame and cover may be used. Installation of the manhole frame and grate shall be as per the manufacturers instructions. Units shall consist of three components, a cover, frame and guide.

Watertight manhole lids are required when sanitary maintenance holes are located within overland storm routes and/or under sanitary surcharge condition.

K 11.00 CONNECTIONS FROM SEWER TO STREET LINE

Only one (1) sanitary sewer connection per property shall be permitted, unless authorized by Haldimand County General Manager of Public Works.

Where an existing sanitary sewer main is to remain in place the connection of a sanitary service lateral may be made at an existing manhole, or directly to the sanitary sewer main if the size of the connection is less than or equal to half of the size of the sanitary sewer main.

If the sanitary service lateral connection size is greater than one half the size of the sanitary sewer main, the connection must be made to a manhole, existing or new. A direct connection to the sanitary sewer main may be accepted with the use of an approved manufactured tee. All connections to existing pipes or manholes shall be completed through coring the pipe or manhole. No intrusions shall be left in the pipe.

Where the sanitary service lateral is to tie into an existing wastewater collection system manhole, an exterior drop structure configuration is to be constructed. Reference OPSD 1003.020 - Cast-In-Place maintenance Hole Drop Structure Wye.

Where a new sanitary main is being constructed all connections shall be made by installation of manufactured tees at all service locations.

In all cases, the invert of the lateral pipe must be above the spring line of the main pipe.
P.V.C Pipe must be used for service connections. For P.V.C. service connections, minimum SDR28 shall be used.

If necessary, concrete encased risers shall be provided for connection with the main sewer.

## Connection Requirements:

| Development | $\frac{\text { Minimum Sewer }}{\text { Lateral Size }}$ <br> $\mathbf{( m m )}$ | Desirable <br> Lateral Slope <br> $\mathbf{( \% )}$ | $\frac{\text { Minimum }}{\text { Lateral Slope }}$ <br> $\mathbf{( \% )}$ | $\frac{\text { Minimum }}{\text { Cover at }}$ <br> Property Line <br> $(\mathbf{m})$ |
| :--- | :---: | :---: | :---: | :---: |
| Residential <br> - Single family <br> - Semi-detatched | 100 | 2.0 | 1.0 | 2.15 |

| Multi-Residential | 150 | See subsection a) Multi- <br> Residential below |  | 2.15 |
| :--- | :---: | :---: | :---: | :---: |
| Industrial <br> Commercial <br> Institutional | 150 | 2.0 | 1.5 | 2.15 |

For all sanitary service laterals greater than thirty (30) meters in length, an approved property line cleanout is required and shall be shown on all design drawings.

Industrial, commercial and institutional developments require a property line monitoring manhole on the sewer lateral service as per the County's Sewer Use Bylaw.

Joints and bedding shall be equivalent to the joints and bedding specified for sewer pipe.

Until the sanitary sewer lateral pipe from the property line to the building has been installed, the location of the end of all lateral connections from the sanitary sewer main to the property line shall be marked by a $50 \mathrm{~mm} \times 100 \mathrm{~mm}$ wooden stake, 2 meters long, projecting one meter above the ground with the top 300 mm painted with fluorescent green colour conforming to Canadian General Standards Board (C.G.S.B.) 603-401.
(a) Multi-Residential: In multiple family blocks in residential areas, the connection shall meet the following requirements:

| Diameter of Drain <br> $(\mathbf{m m})$ | Slope of Drain |  |  |
| :--- | :--- | :--- | :---: |
|  | $\mathbf{2 . 0 \%}$ | $\mathbf{4 . 0 \%}$ |  |
| (Max. No. of Fixture Units per conn.) |  |  |  |
| 150 | 840 | 1000 |  |
| 200 | 1920 | 2300 |  |
| 250 | 3500 | 4200 |  |
| 300 | 5600 | 6700 |  |
| 375 | 10000 | 12000 |  |

| Maximum Dwelling Units Densities |  |
| :--- | :--- |
| 4 -plex | 25 units/hectare |
| Townhouse | 37 units/hectare |
| Maisonette | 45 units/hectare |
| Apartments | 124 units/hectare |

## Loading - 20 fixtures units/dwelling unit

## To Use the Chart

i) Determine dwelling density and total area of block
ii) Calculate total number of fixture units from:

Area $\times$ Dwelling units/hectare $\times 20$
iii) Select connection size and grade from chart.
iv) The minimum requirement shall be 150 mm diameter at $1.5 \%$ grade.

## K $11.01 \quad$ PRIVATE SIDE SEWER LATERALS

The following requirements apply to all private side laterals connecting a building drain to a municipal sanitary sewer in Haldimand County.

## MATERIALS

When these materials are used they must be installed as per the OBC and this Design Criteria.
a) PVC SDR 28 with Gasket Fittings conforming to CAN/CSA-B182.2 is the preferred choice of sewer lateral pipe (as a minimum)
b) PVC SDR 26 with Gasket Fittings conforming to CAN/CSA-B182.2 is acceptable as well.

As per 7.2.5.10.(2) all plastic pipe used underground shall have a stiffness equal or greater than 320 kPa .

## INSTALLATION

All piping when installed for a sewer lateral must be installed as per manufacturers instructions. Manufactures requirements must be followed for foundation, bedding, haunching, initial and final backfill of piping installed for sewer laterals. Any installation that is performed in a manner that does not meet manufacturers installation requirements will be deemed for the purpose of this design criteria not to meet the Ontario Building Code.

## MINIMUM TESTING REQUIREMENTS

All sewer laterals will be pressure tested as per OBC 7.3.6.4.(1)(2)(a)(b) Water Test or 7.3.6.5.(1)(a)(b) Air Test. A flow test will be conducted as well to ensure grade and to confirm there are no blockages in the lateral or lateral extension. A test "T" or " $Y$ " fitting will be required to be installed in the sewer lateral immediately upstream of the lateral extension. After the test has passed the required test fitting shall be
capped by an approved fitting and will seen by the inspector before backfill has been completed.

## INSPECTIONS

Inspections by the Haldimand County Building Department shall be conducted and will consist of two separate inspections. The first required inspection shall be to confirm there is proper bedding for the lateral, the correct pipe has been installed, the approved method of joining has been adhered to and that the pipe has the correct grade as per O.B.C requirements. The second required inspection will be to view the pressure test, flow test, an initial backfill of 300 mm of carefully placed clean fill or gravel (to ensure there are no large chunks and/or frozen earth, rocks, boulders etc. over the pipe), and to witness the permanent capping of the test fitting. It will be accepted that both inspections may be the same day and within a short period of time if required.

K 12.00 SEWAGE FORCEMAINS
K $\mathbf{1 2 . 0 1}$ TYPE OF PIPE AND JOINT ACCEPTABLE FOR SEWAGE FORCEMAINS
a) Ductile Iron Cement Lined Pipe

Ductile iron cement lined pipe with Tyton joints or equivalent may be used. The current requirement of AWWA C150 and AWWA C104 shall apply to all classes of ductile iron pipe.
b) Poly-vinyl Chloride (P.V.C.) Pipe

For sizes up to 600 mm , P.V.C. pipe with gasketed joints may be used. The current requirements of CSA B137.3 shall apply to all classes of P.V.C. pipe.
C) Polyethylene (P.E.) Pressure Pipe

Polyethylene pressure pipe with joints made by thermal fusion or by mechanical means may be used. The polyethylene resin compound used in the pipe shall conform to current ASTM Designation D1248. The pipe shall be manufactured to CGSB 41-GP-25M specifications.
d) Reinforced Concrete Pressure Pipe

For sizes 400 mm and over, reinforced concrete pressure pipe with
gasketed joints may be used as indicated below:
Pre-tensioned concrete cylinder pipe conforming to AWWA C-303.

Pre-stressed concrete lined cylinder pipe conforming to AWWA C301.

## K 12.02 PIPE SIZE

The forcemain shall be sized to have flow velocity in the range of 0.8 to $2.5 \mathrm{~m} / \mathrm{s}$ with the lower limit being preferred for the initial phase. However, the minimum size shall not be less than 100 mm .

## K 12.03 PIPE DEPTH

The top of the forcemain shall have a minimum of 1.7 m cover. On open ditch or unimproved road, increased cover shall be provided to allow for future road improvement or lowering when urbanization takes place.

## K 12.04 SYSTEM DESIGN

a) Haldimand County's preference is to avoid thrust blocks if possible, giving preference to appropriate mechanical restraint. All forcemains and thrust blocks shall be designed to withstand the maximum operating pressure plus the transient pressure to which they will be subjected.
b) All forcemains shall be equipped with a suitably valved connection to permit connection of a portable pump should pumping stations need to be by-passed during emergencies or major modifications.
c) Air release valves suitable for use with sewage shall be positioned at all forcemain high points. The valves shall be of low-pressure double acting type.
d) All plugs, tees, and bends will have approved thrust blocks (at Haldimand County discretion) or suitable alternatives i.e. noncorrosive clamps and bell bolt joints, restraining type glands rings.
e) The bedding requirements for the forcemains will depend upon the type and class of pipe used. As a minimum requirement, forcemain pipe shall be laid on 150 mm of selected native material bedding. However, each installation shall be reviewed on a site specific basis.
f) The type of backfill material will usually be determined from the location of mains within the R.O.W. Under road pavement, granular backfill will be provided.

K 12.05 PRIVATE FORCEMAINS

It is the preference of the County that all structures be connected to the County's sanitary sewer system by means of gravity connections.

There are situations where gravity access to existing County sanitary sewers is not feasible. Where these instances arise, an application must be made to the Water and Wastewater Operations Division requesting the installation of a private sanitary forcemain. Each application will be reviewed on a site-specific basis. A permit for the installation of a private forcemain will only be allowed with the written approval of the Manager of Water and Wastewater Operations.

## SANITARY SEWERS -PREFERRED DESIGN RANGE

|  |  | Concrete Pipe | P.V.C. Pipe | Truss Pipe | Polyethylene (P.E.) Pipe | Ductile Iron Pipe |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| RESIDENTIAL MAINS | Dia. | $>300 \mathrm{~mm}$ | 200 mm to 675 mm | 200 to 375 mm |  |  |
|  | Joint | Bell \& Spigot | Gasket joint | Solvent Weld |  |  |
| COMMERCIAL MAINS | Dia. | $>300 \mathrm{~mm}$ | 300-675 | Not Allowed |  |  |
|  | Joint | Bell \& Spigot <br> Spigot | Gasket joint | Not Allowed |  |  |
| INDUSTRIAL MAINS | Dia. | $>600 \mathrm{~mm}$ | 375-675 | Not Allowed |  |  |
|  | Joint | Bell \& Spigot | Gasket joint | Not Allowed |  |  |
| SERVICE LATERALS | Dia. | Not Allowed | $>100 \mathrm{~mm}$ Res. Only <br> $>150 \mathrm{~mm} \mathrm{I} / \mathrm{C} / \mathrm{I}$ | Not Allowed |  |  |
|  | Joint | Not Allowed | Gasket joint | Not Allowed |  |  |
| FORCEMAINS | Dia. | $>400 \mathrm{~mm}$ pressured | <600mm | Not Allowed | <600mm |  |
|  | Joint | Bell \& Spigot with gasket | Plas-tyton gasket joint | Not Allowed | Butt fusion |  |

## LIST OF APPROVED MANUFACTURERS AND PRODUCTS FOR WASTEWATER SYSTEMS
